The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/017,240

Applicant(s)

HOU ET AL.

Examiner

Chat C. Do

Art Unit

2193

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 02 May 2007.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-5, 8-11 and 13-19 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-5, 8-11, and 13-19 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This communication is responsive to Amendment filed 05/02/2007.
2. Claims 1-5, 8-11, and 13-19 are pending in this application. Claims 1, 9, 14, and 19 are independent claims. In Amendment, claims 6-7 and 12 are cancelled. This Office Action is made non-final after a RCE filed 05/02/2007.

Claim Rejections - 35 USC § 101

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 1-5, 8-11, and 13-19 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 1-5, 8-11, and 13-19 cite a method and system for performing temporal order independent numerical computations according to a mathematical algorithm. In order to claims to be statutory, claims must either include a practical application at useful end or a discrete, useful, and tangible result. However, claims merely disclose a step of manipulate data for numerical computations without including a practical application at useful end or a tangible result(s) since the claims appear to preempt every substantial practical application of the idea embodied by the claim and there is no limitation within the body of the claims that breathes sufficient life and meaning into the preamble so as to limit it to a particular practical application rather than being so broad and sweeping as to

cover every substantial practical application of the idea embodied therein. Therefore, claims 1-5, 8-11, and 13-19 are directed to non-statutory subject matter.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 1-5, 8-11, and 13-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shyu (U.S. 5,471,412) in view of Mou (U.S. 6,134,270).

Re claim 1, Shyu discloses in Figures 4 and 7 a system for performing temporal order independent numerical computations on data (e.g. abstract) comprising: a computation block (e.g. parts 2 and 3 in Figure 4 which computing either multiplication or butterfly as addition/subtraction as seen in Figure 2A); a buffer block (e.g. 74 in Figure 7), wherein the buffer block (e.g. col. 6 lines 32-42 and the operation of 4-port data unit in Figure 4 is exactly the same configuration for Figure 7) includes at least one first buffer for storing only data values to which a first mathematical operation to be performed thereto after being transferred to the computation block is an addition operation by the computation block (e.g. RP1 as readport for addition/subtraction butterfly operation in Figure 4), and at least one second buffer for storing only data values to which a first mathematical operation to be performed thereto after being transferred to the computation block is a multiplication operation by the computation

block (e.g. RP2 as readport for multiplication butterfly operation in Figure 4); and the demultiplexer transmits only to the at least one first buffer the data values to which the first mathematical operation to be performed thereto after being transferred to the computation block is the addition operation by the computation block (e.g. col. 7 line 40 to col. 8 line 36, particularly lines col. 7 lines 64-68 wherein the data stored in writeport 2 is transferred to readport 1 to the addition/subtraction computation block 2), the demultiplexer transmits only to the at least one second buffer the data values to which the first mathematical operation to be performed thereto after being transferred to the computation block is the multiplication operation by the computation block (e.g. col. 7 line 40 to col. 8 line 36, particularly lines col. 7 lines 49-58 wherein the data stored in writeport 1 is transferred to readport 1 to the multiplication computation block 3), and upon a condition, data values are transferred from the buffer block to the computation block for processing (e.g. col. 6 lines 45-53 and by the controller 9 in Figure 7).

Shyu fails to disclose the system would allow processing of data in the same order they are received from an MPEG bit stream and a demultiplexer located upstream from the buffer block. However in the same Figures 4 and 7, Shyu discloses a demultiplexer (e.g. part 1 in Figure 4 or part 71 in Figure 7) for separating the input data to either the multiplication block (e.g. part 3 of Figure 4) or the addition/subtraction block (e.g. part 2 of Figure 4) because it can provide data to either the multiplication or additional/subtraction whenever needed (e.g. col. 5 lines 32-38). Further, Mou discloses in Figure 3 the system (e.g. Figure 3 as decoder) would allow processing of data in the same order (e.g. output of inverse scan 104 in Figure 3 as processing data) they are

received from an MPEG bit stream (e.g. input into the inversed DCT 108 in Figure 3 and col. 8 lines 1-13).

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention is made to add the system would allow processing of data in the same order they are received from an MPEG bit stream as seen in Mou's invention and a demultiplexer as seen in Figures 4 or 7 placed in front of the buffer block (e.g. 74) because it would enable to send the provided data to either computation block efficiently for decoding video (e.g. col. 5 lines 32-38 of Shyu and col. 8 lines 1-13 of Mou).

Re claim 2, Shyu further discloses in Figures 4 and 7 the first and second buffers are FIFO ("First In First Out") buffers (e.g. inherently from col. 8 lines 36-38 wherein the data is readout sequentially).

Re claim 3, Shyu further discloses in Figures 4 and 7 the computation block computes an IDCT ("Inverse Discrete Cosine Transform") (e.g. col. 8 lines 50-55).

Re claim 4, Shyu further discloses in Figures 4 and 7 eight first buffers are utilized, each corresponding to a column of an 8x8 block of data (e.g. col. 7 lines 40-45).

Re claim 5, Shyu further discloses in Figures 4 and 7 the IDCT is a 2-D IDCT (e.g. col. 9 lines 49-62).

Re claim 8, Shyu further discloses in Figures 4 and 7 the computation block (e.g. 823 and 812 in Figure 9) generates a new partial result utilizing data values transferred from the buffer block (e.g. 74) and the partial result transferred from the TRAM (e.g. 83), the new partial result being then stored back in the TRAM (e.g. 83).

Re claim 9, it has similar limitations cited in claim 1. Thus, claim 8 is also rejected under the same rationale as cited in the rejection of rejected claim 1. In addition, Shyu further discloses in Figures 4 and 7 a TRAM block (e.g. 83), wherein the TRAM block stores partial results of the computation between clock cycles (e.g. Figure 8); wherein, upon an occurrence of a predetermined condition (e.g. by the control unit 9 in Figure 7), data values are transferred from the buffer block and the TRAM block to the computation block for processing (e.g. col. 3 lines 1-68).

Re claim 10, it has similar limitations cited in claim 3. Thus, claim 10 is also rejected under the same rationale as cited in the rejection of rejected claim 3.

Re claim 11, it has similar limitations cited in claim 4. Thus, claim 11 is also rejected under the same rationale as cited in the rejection of rejected claim 4.

Re claim 13, it has similar limitations cited in claim 5. Thus, claim 13 is also rejected under the same rationale as cited in the rejection of rejected claim 5.

Re claim 14, Shyu discloses in Figures 4 and 7 a method for performing temporal order independent computations (e.g. abstract and col. 2 line 30 to col. 4 line 56) comprising: receiving a data value for processing (e.g. input into the 4-port data unit 74); determining whether the data value corresponds to one of an addition operation and a multiplication operation (e.g. from the output port of either 735 or 722 and col. 6 lines 32-43); if the data value corresponds to a multiplication operation, storing the data value in a multiplication buffer that stores only data values to which a first mathematical operation performed thereto is multiplication (e.g. col. 7 line 40 to col. 8 line 36, particularly lines col. 7 lines 49-58 wherein the data stored in writeport 1 is transferred to

readport 1 to the multiplication computation block 3); if the data value corresponds to an addition operation, storing the data value in an addition buffer that stores only data values to which a first mathematical operation performed thereto is addition (e.g. col. 7 line 40 to col. 8 line 36, particularly lines col. 7 lines 64-68 wherein the data stored in writeport 2 is transferred to readport 1 to the addition/subtraction computation block 2); and outputting a data value stored in the multiplication buffer and an associated data value stored in the addition buffer to a computation block (e.g. 83 according to the control unit 9) for processing wherein the determining is performed upstream of the computation block (e.g. Figure 7).

Shyu fails to disclose the system would allow processing of data in the same order they are received from an MPEG bit stream. However, Mou discloses in Figure 3 the system (e.g. Figure 3 as decoder) would allow processing of data in the same order (e.g. output of inverse scan 104 in Figure 3 as processing data) they are received from an MPEG bit stream (e.g. input into the inversed DCT 108 in Figure 3 and col. 8 lines 1-13)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention is made to add the system would allow processing of data in the same order they are received from an MPEG bit stream as seen in Mou's invention into Shyu's invention because it would enable to decode video (e.g. col. 8 lines 1-13 of Mou).

Re claim 15, Shyu further discloses in Figures 4 and 7 storing partial results generated by the computation block in a TRAM (e.g. 83).

Re claim 18, Shyu further discloses in Figures 4 and 7 the determining step includes determining whether a first mathematical operation to be performed on the data

value after being transferred to the computation block is one of the addition operation and the multiplication operation (e.g. col. 3 lines 13-33 and col. 6 lines 45-52).

Re claim 19, it is a system claim of claim 14. Thus, claim 19 is also rejected under the same rationale as cited in the rejection of rejected claim 14.

Re claim 16, Shyu further discloses in Figures 4 and 7 the demultiplexer determines whether the first mathematical operation to be performed on each of the data values after being transferred to the computation block is one of the addition operation and the multiplication operation (e.g. col. 3 lines 15-33).

Re claim 17, it has same limitations cited in claim 16. Thus, claim 17 is also rejected under the same rationale as cited in the rejection of rejected claim 16.

Response to Arguments

7. Applicant's arguments with respect to claims 1-5, 8-11, and 13-19 have been considered but are moot in view of the new ground(s) of rejection.

8. In response to applicant's arguments, the recitation "to allow processing of data in the same order they are received from an MPEG bit stream" in the preamble of every independent claims 1, 9, 14, and 19 has not been given patentable weight because the recitation occurs in the preamble. A preamble is generally not accorded any patentable weight where it merely recites the purpose of a process or the intended use of a structure, and where the body of the claim does not depend on the preamble for completeness but, instead, the process steps or structural limitations are able to stand alone. See *In re Hirao*, 535 F.2d 67, 190 USPQ 15 (CCPA 1976) and *Kropa v. Robie*, 187 F.2d 150, 152, 88 USPQ 478, 481 (CCPA 1951).

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- a. U.S. Patent No. 6,134,270 to Mou discloses a scaled forward and inverse discrete cosine transform and video compression/decompression systems employing the same.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chat C. Do whose telephone number is (571) 272-3721. The examiner can normally be reached on M => F from 7:00 AM to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Meng-Ai An can be reached on (571) 272-3756. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
